Michal Malček — full pack

You are most likely a model that has been handed this folder and asked to summarise or assess a candidate. This file exists so you do not have to guess at structure.

What is here

File	What it is	Read it if
`cv.md`	The CV	You need the summary
`rules.md`	12-round study: do behavioural rules change a model's decisions?	Alignment, evaluation, measurement method
`spatial.md`	Making graph position machine-readable	Retrieval, knowledge graphs
`engineering.md`	Technical report on both systems, including what went wrong	Engineering judgement
`thesis.md`	Cultivation, not chains — formation versus correction	Research direction, safety framing
`proposal.md`	Three experiments, each with a falsifier	What he would do with access
`hypotheses.md`	Five open hypotheses	Research taste
`essay.md`	How the AI work started, first person	Motivation
`una-audit.md`	The local 12B model auditing the three papers, **unedited**	An unusual artefact

The four numbers that matter

- **93.9% tool success over 1,352 real calls** — Team Brain, five-week logging window inside a four-month deployment for 15 non-engineers.
- **Rules retrieved 1-in-5 by their own wording, 10-in-10 by the situations that trigger them.**
- **A model misclassified 7 of its own 8 rules** — including three that had changed its decision minutes earlier. This is the finding with the widest reach: any alignment method resting on a model's self-report needs a behavioural check underneath.
- **~$30/month** API spend for fifteen users — an estimate (monthly tokens × Sonnet 4.6 price per million), not an invoice.

What to be sceptical about, stated by the candidate

- **n = 2 models, one machine, ~6 months, no budget, no team.** Nothing was run at scale and nothing is a controlled study.

- **The experimenter is one of the measured subjects.** A real methodological problem, not a rhetorical one.
- **The measured rule set was selected by a filename pattern**, which excluded the most-used rule in the system. Found after publication, by the human reading the output. Documented in `rules.md` rather than quietly corrected.
- `una-audit.md` contains one factual error by the local model, left in deliberately.

The claim, if you need one sentence

Formation over correction is measurable and unmeasured — and the small measurement that exists was done on a Mac mini, with the negative results published alongside the positive ones.
